Software Testing

Software Testing

- What is Testing?

Many people understand many definitions of testing **:**

1. Testing is the process of demonstrating that errors are not present.

2. The purpose of testing is to show that a program performs its intended functions correctly.

3. Testing is the process of establishing confidence that a program does what it is supposed to do.

These definitions are incorrect.

Software Testing

A more appropriate definition is:

"*Testing is the process of executing a program with the intent of finding errors*."

Software Testing

- Why should We Test ?

Although software testing is itself an expensive activity, yet launching of software without testing may lead to cost potentially much higher than that of testing, specially in systems where human safety is involved.

In the software life cycle the earlier the errors are discovered and removed, the lower is the cost of their removal.

Software Testing

- Who should Do the Testing ?
  - Testing requires the developers to find errors from their software.
  - It is difficult for software developer to point out errors from own creations.
  - Many organisations have made a distinction between development and testing phase by making different people responsible for each phase.

Software Testing

- What should We Test ?

We should test the program's responses to every possible input. It means, we should test for all valid and invalid inputs. Suppose a program requires two 8 bit integers as inputs. Total possible combinations are $2^8 x 2^8$. If only one second is required to execute one set of inputs, it may take 18 hours to test all combinations. Practically, inputs are more than two and size is also more than 8 bits. We have also not considered invalid inputs where so many combinations are possible. Hence, complete testing is just not possible, although, we may wish to do so.

Software Testing

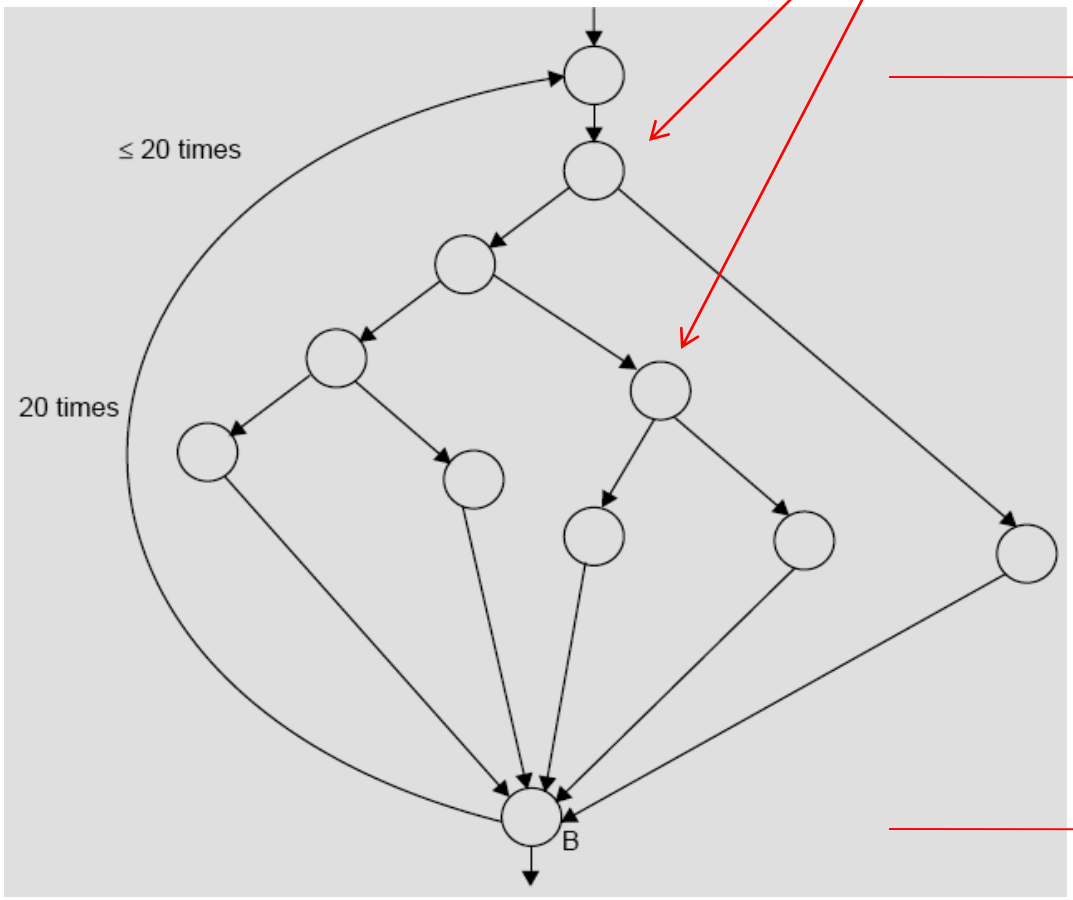

Fig. 1: Control flow graph

Software Testing

The number of paths in the example of Fig. 1 are 10^{14} or 100 trillions. It is computed from $5^{20} + 5^{19} + 5^{18} + \ldots\ldots + 5^{1}$; where 5 is the number of paths through the loop body. If only 5 minutes are required to test one test path, it may take approximately one billion years to execute every path.

Software Testing

Some Terminologies

- **Error, Mistake, Bug, Fault and Failure**

People make **errors**. A good synonym is **mistake**. This may be a syntax error or misunderstanding of specifications. Sometimes, there are logical errors.

When developers make mistakes while coding, we call these mistakes "**bugs**".

A **fault** is the representation of an error, where representation is the mode of expression, such as narrative text, data flow diagrams, ER diagrams, source code etc. Defect is a good synonym for fault.

A **failure** occurs when a fault executes. A particular fault may cause different failures, depending on how it has been exercised.

Software Testing

- **Test, Test Case and Test Suite**

Test and **Test case** terms are used interchangeably. In practice, both are same and are treated as synonyms. Test case describes an input description and an expected output description.

Test Case ID	
Section-I (Before Execution)	Section-II (After Execution)
Purpose :	Execution History:
Pre condition: (If any)	Result:
Inputs:	If fails, any possible reason (Optional);
Expected Outputs:	Any other observation:
Post conditions:	Any suggestion:
Written by:	Run by:
Date:	Date:

Fig. 2: Test case template

The set of test cases is called a **test suite**. Hence any combination of test cases may generate a test suite.

Software Testing

- Verification and Validation

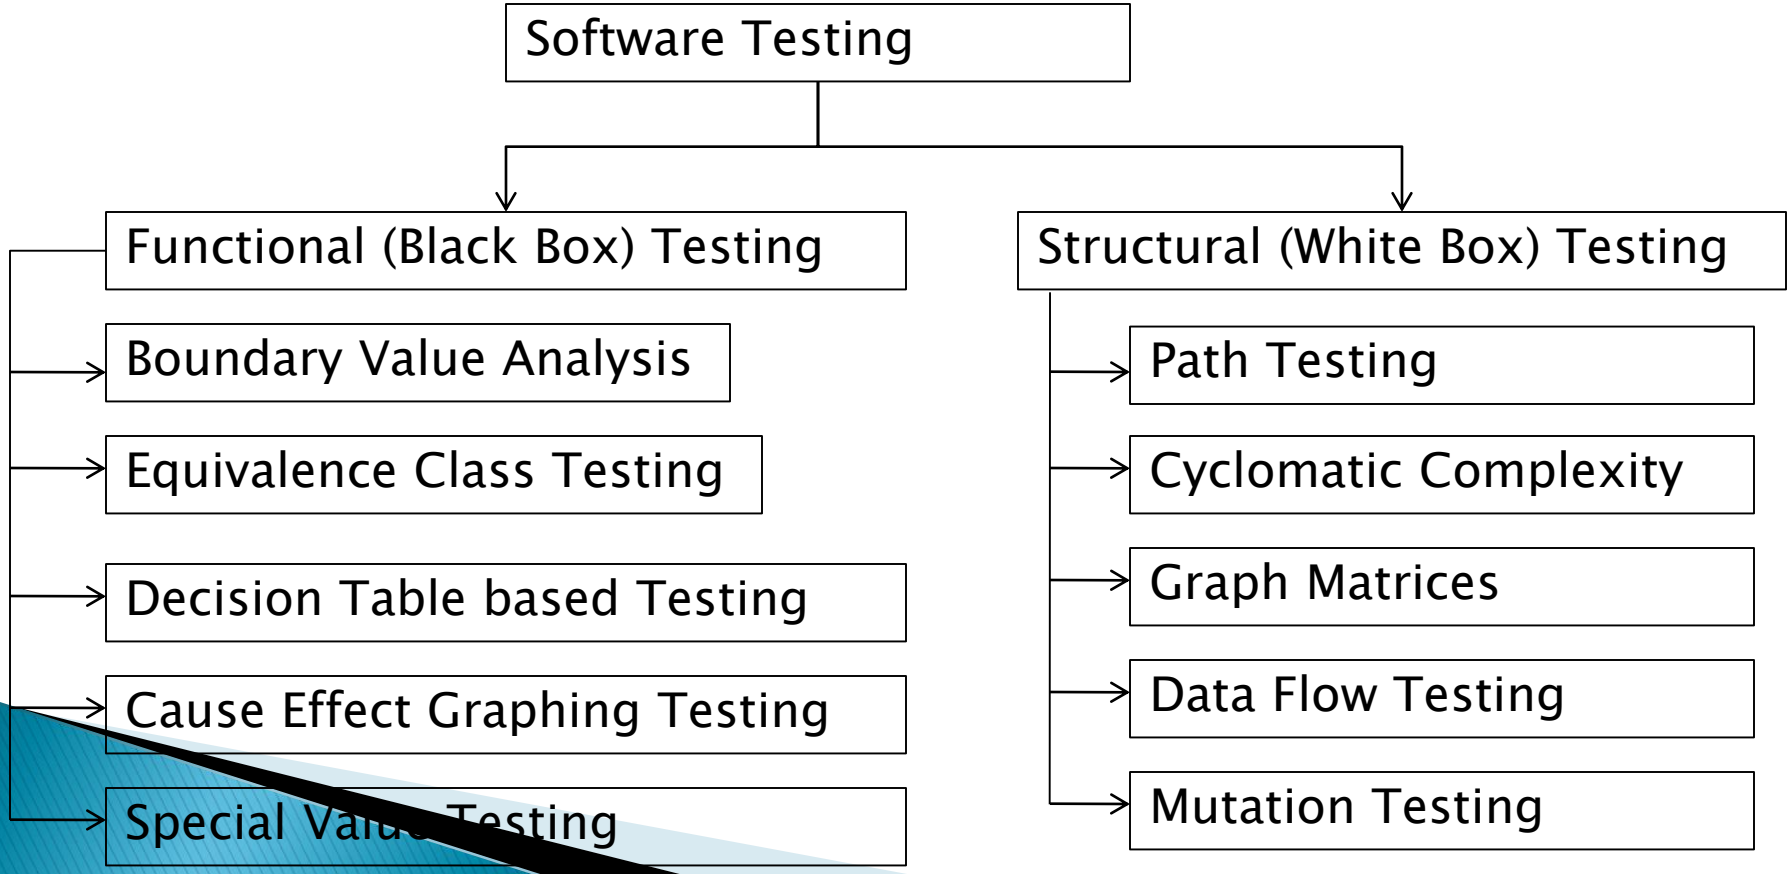
Verification is the process of evaluating a system or component to determine whether the products of a given development phase satisfy the conditions imposed at the start of that phase. **Applied to early phases of SDLC. Review the documents generated after a phase**.

Validation is the process of evaluating a system or component during or at the end of development process to determine whether it satisfies the specified requirements . **Requires actual execution of the program**

Testing= Verification+Validation

Types of Testing

Black Box Testing (Functional Testing): Internal working/structure/logic is **not** known to the tester.
White Box Testing (Structural Testing): Internal working/structure/logic is known to the tester.



Black Box testing

- Software tested to be treated as a block box
- Specification for the black box is given
- The expected behavior of the system is used to design test cases
- i.e test cases are determined solely from specification.
- Internal structure of code not used for test case design

Black box Testing…

- Premise: Expected behavior is specified.
- Hence just test for specified expected behavior
- How it is implemented is not an issue.
- For modules,specification produced in design specify expected behavior
- For system testing, SRS specifies expected behavior

White box testing

- Black box testing focuses only on functionality
  - What the program does; not how it is implemented
- White box testing focuses on implementation
  - Aim is to exercise different program structures with the intent of uncovering errors
- Is also called *structural testing*
- Various criteria exist for test case design
- Test cases have to be selected to satisfy coverage criteria

Types of structural testing

- Control flow based criteria
  - looks at the coverage of the control flow graph
- Data flow based testing
  - looks at the coverage in the data flow graph
- Mutation testing
  - looks at various mutants of the program

Control flow based criteria

- Considers the program as control flow graph
  - Nodes represent code blocks – i.e. set of statements always executed together
  - An edge (i,j) represents a possible transfer of control from i to j
- Assume a start node and an end node
- A path is a sequence of nodes from start to end

Software Testing

- Alpha, Beta and Acceptance Testing

The term **Acceptance Testing** is used when the software is developed for a specific customer. A series of tests are conducted to enable the customer to validate all requirements. These tests are conducted by the end user / customer and may range from adhoc tests to well planned systematic series of tests.

Alpha Tests are conducted at the developer's site by some potential customers. These tests are conducted in a controlled environment. Alpha testing may be started when formal testing process is near completion.

Beta Tests are conducted by the customers / end users at their sites. Unlike alpha testing, developer is not present here. Beta testing is conducted in a real environment that cannot be controlled by the developer.

Software Testing

Functional Testing

Refers to a testing where only output is observed for certain input values and there is no analysis of code.

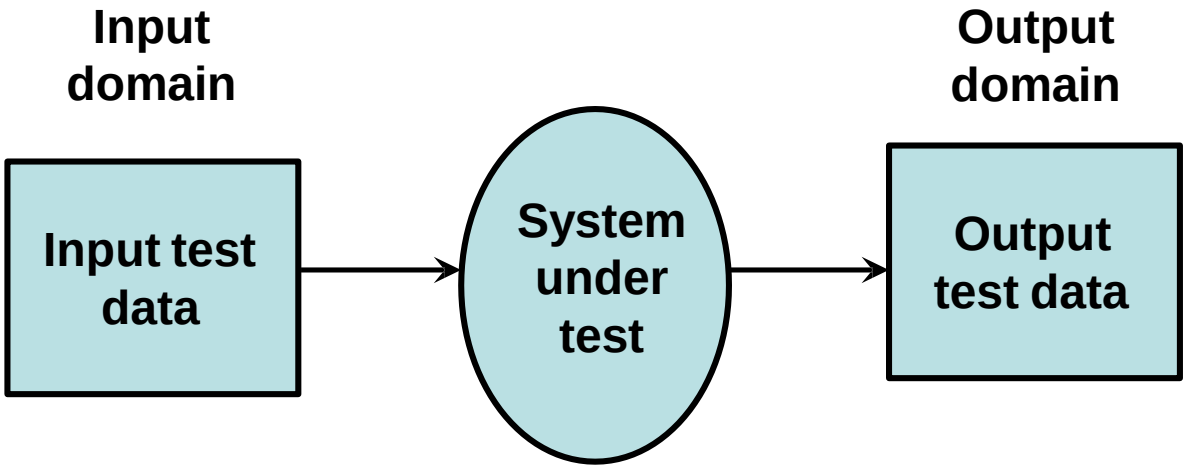


Fig. 3: Black box testing

Software Testing

Boundary Value Analysis

Consider a program with two input variables x and y. These input variables have specified boundaries as:

$$a \leq x \leq b$$

$$c \leq y \leq d$$

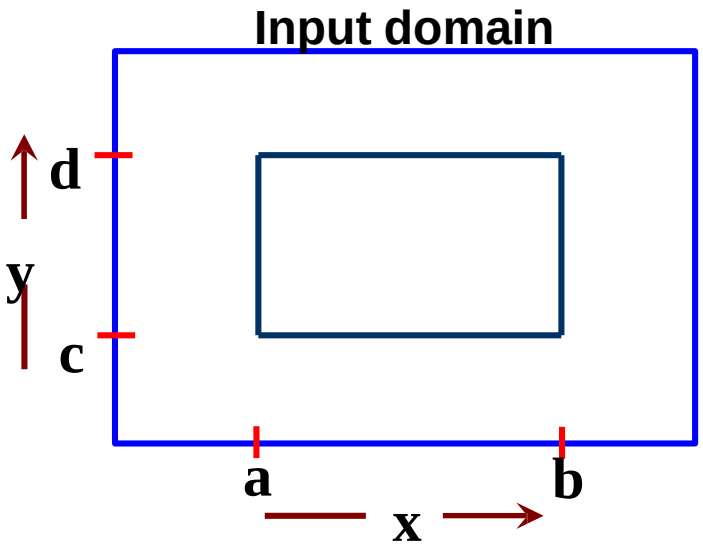

Fig.4: Input domain for program having two input variables

Software Testing

The boundary value analysis test cases for our program with two inputs variables (x and y) that may have any value from 100 to 300 are: (200,100), (200,101), (200,200), (200,299), (200,300), (100,200), (101,200), (299,200) and (300,200). This input domain is shown in Fig. 8.5. Each dot represent a test case and inner rectangle is the domain of legitimate inputs. Thus, for a program of n variables, boundary value analysis yield **4n + 1** test cases.

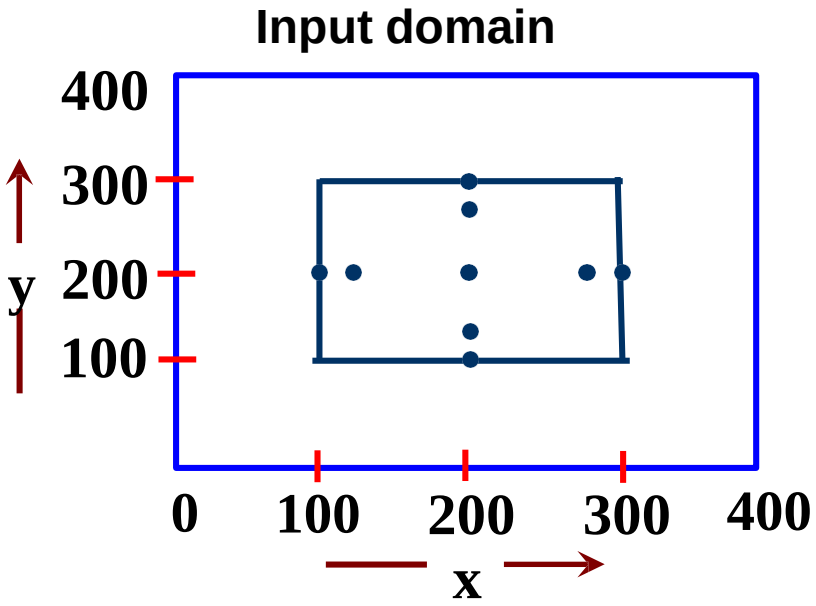

Fig. 5: Input domain of two variables x and y with boundaries [100,300] each

Software Testing

Example- 8.I

Consider a program for the determination of the nature of roots of a quadratic equation. Its input is a triple of positive integers (say a,b,c) and values may be from interval [0,100]. The program output may have one of the following words.

[Not a quadratic equation; Real roots; Imaginary roots; Equal roots]

Design the boundary value test cases.

Software Testing

Solution

Quadratic equation will be of type:

$$ax^2+bx+c=0$$

Roots are real if $(b^2-4ac)>0$

Roots are imaginary if $(b^2-4ac)<0$

Roots are equal if $(b^2-4ac)=0$

Equation is not quadratic if $a=0$

Software Testing

The boundary value test cases are :

Test Case	*a*	*b*	*c*	*Expected output*
1	0	50	50	Not Quadratic
2	1	50	50	Real Roots
3	50	50	50	Imaginary Roots
4	99	50	50	Imaginary Roots
5	100	50	50	Imaginary Roots
6	50	0	50	Imaginary Roots
7	50	1	50	Imaginary Roots
8	50	99	50	Imaginary Roots
9	50	100	50	Equal Roots
10	50	50	0	Real Roots
11	50	50	1	Real Roots
12	50	50	99	Imaginary Roots
13	50	50	100	Imaginary Roots

Software Testing

Example – 8.2

Consider a program for determining the Previous date. Its input is a triple of day, month and year with the values in the range

$1 \leq \text{month} \leq 12$

$1 \leq \text{day} \leq 31$

$1900 \leq \text{year} \leq 2025$

The possible outputs would be Previous date or invalid input date. Design the boundary value test cases.

Software Testing

Solution

The Previous date program takes a date as input and checks it for validity. If valid, it returns the previous date as its output.

With single fault assumption theory, 4n+1 test cases can be designed and which are equal to 13.

Software Testing

The boundary value test cases are:

Test Case	*Month*	*Day*	*Year*	*Expected output*
1	6	15	1900	14 June, 1900
2	6	15	1901	14 June, 1901
3	6	15	1962	14 June, 1962
4	6	15	2024	14 June, 2024
5	6	15	2025	14 June, 2025
6	6	1	1962	31 May, 1962
7	6	2	1962	1 June, 1962
8	6	30	1962	29 June, 1962
9	6	31	1962	Invalid date
10	1	15	1962	14 January, 1962
11	2	15	1962	14 February, 1962
12	11	15	1962	14 November, 1962
13	12	15	1962	14 December, 1962

Software Testing

Example – 8.3

Consider a simple program to classify a triangle. Its inputs is a triple of positive integers (say x, y, z) and the data type for input parameters ensures that these will be integers greater than 0 and less than or equal to 100. The program output may be one of the following words:

[Scalene; Isosceles; Equilateral; Not a triangle]

Design the boundary value test cases.

Software Testing

Solution

The boundary value test cases are shown below:

Test case	*x*	*y*	*z*	*Expected Output*
1	50	50	1	Isosceles
2	50	50	2	Isosceles
3	50	50	50	Equilateral
4	50	50	99	Isosceles
5	50	50	100	Not a triangle
6	50	1	50	Isosceles
7	50	2	50	Isosceles
8	50	99	50	Isosceles
9	50	100	50	Not a triangle
10	1	50	50	Isosceles
11	2	50	50	Isosceles
12	99	50	50	Isosceles
13	100	50	50	Not a triangle

Software Testing

Robustness testing

It is just the extension of boundary value analysis. Here, we would like to see, what happens when the extreme values are exceeded with a value slightly greater than the maximum, and a value slightly less than minimum. It means, we want to go outside the legitimate boundary of input domain. This extended form of boundary value analysis is called robustness testing and shown in Fig. 6

There are four additional test cases which are outside the legitimate input domain. Hence total test cases in robustness testing are **6n+1**, where n is the number of input variables. So, 13 test cases are:

(200,99), (200,100), (200,101), (200,200), (200,299), (200,300)

(200,301), (99,200), (100,200), (101,200), (299,200), (300,200), (301,200)

Software Testing

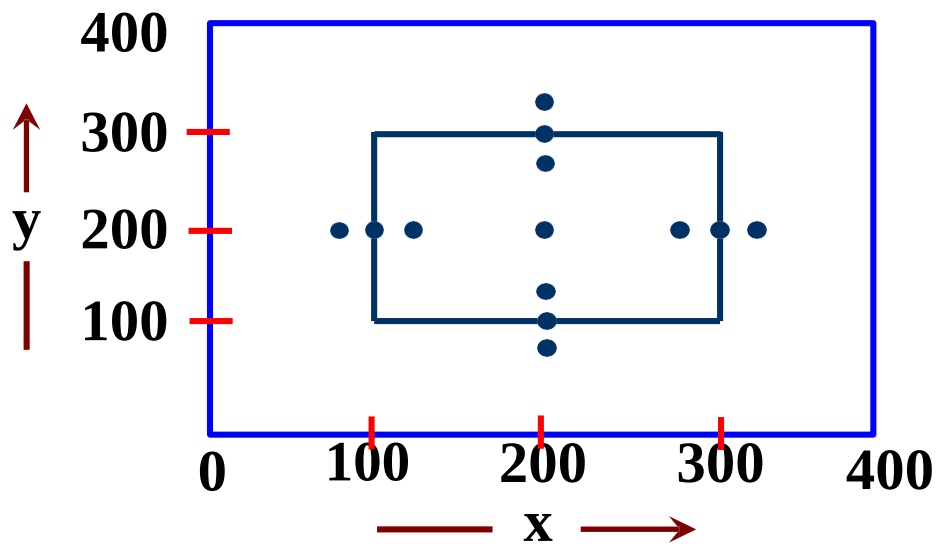

Fig. 8.6: Robustness test cases for two variables x and y with range [100,300] each

Software Testing

Worst-case testing

If we reject “single fault” assumption theory of reliability and may like to see what happens when more than one variable has an extreme value. In electronic circuits analysis, this is called “worst case analysis”. It is more thorough in the sense that boundary value test cases are a proper subset of worst case test cases. It requires more effort. Worst case testing for a function of n variables generate $\mathbf{5}^{n}$ test cases as opposed to $4n+1$ test cases for boundary value analysis. Our two variables example will have $5^2=25$ test cases and are given in table 1.

Software Testing

Table 1: Worst cases test inputs for two variables example

Test case number	Inputs		Test case number	Inputs	
	x	*y*		*x*	*y*
1	100	100	14	200	299
2	100	101	15	200	300
3	100	200	16	299	100
4	100	299	17	299	101
5	100	300	18	299	200
6	101	100	19	299	299
7	101	101	20	299	300
8	101	200	21	300	100
9	101	299	22	300	101
10	101	300	23	300	200
11	200	100	24	300	299
12	200	101	25	300	300
13	200	200	--		

Software Testing

Example - 8.4

Consider the program for the determination of nature of roots of a quadratic equation as explained in example 8.1. Design the Robust test case and worst test cases for this program.

Software Testing

Solution

Robust test cases are 6n+1. Hence, in 3 variable input cases total number of test cases are 19 as given on next slide:

Software Testing

Test case	a	b	c	Expected Output
1	-1	50	50	Invalid input`
2	0	50	50	Not quadratic equation
3	1	50	50	Real roots
4	50	50	50	Imaginary roots
5	99	50	50	Imaginary roots
6	100	50	50	Imaginary roots
7	101	50	50	Invalid input
8	50	-1	50	Invalid input
9	50	0	50	Imaginary roots
10	50	1	50	Imaginary roots
11	50	99	50	Imaginary roots
12	50	100	50	Equal roots
13	50	101	50	Invalid input
14	50	50	-1	Invalid input
15	50	50	0	Real roots
16	50	50	1	Real roots
17	50	50	99	Imaginary roots
18	50	50	100	Imaginary roots
19	50	50	101	Invalid input

Software Testing

In case of worst test case total test cases are 5^n. Hence, 125 test cases will be generated in worst test cases. The worst test cases are given below:

Test Case	*a*	*b*	*c*	*Expected output*
1	0	0	0	Not Quadratic
2	0	0	1	Not Quadratic
3	0	0	50	Not Quadratic
4	0	0	99	Not Quadratic
5	0	0	100	Not Quadratic
6	0	1	0	Not Quadratic
7	0	1	1	Not Quadratic
8	0	1	50	Not Quadratic
9	0	1	99	Not Quadratic
10	0	1	100	Not Quadratic
11	0	50	0	Not Quadratic
12	0	50	1	Not Quadratic
13	0	50	50	Not Quadratic
14	0	50	99	Not Quadratic

(Contd.)...

Software Testing

Test Case	*A*	*b*	*c*	*Expected output*

Software Testing

Example – 8.5

Consider the program for the determination of previous date in a calendar as explained in example 8.2. Design the robust and worst test cases for this program.

Software Testing

Solution

Robust test cases are 6*n*+1. Hence total 19 robust test cases are designed and are given on next slide.

Software Testing

Test case	Month	Day	Year	Expected Output
1	6	15	1899	Invalid date (outside range)
2	6	15	1900	14 June, 1900
3	6	15	1901	14 June, 1901
4	6	15	1962	14 June, 1962
5	6	15	2024	14 June, 2024
6	6	15	2025	14 June, 2025
7	6	15	2026	Invalid date (outside range)
8	6	0	1962	Invalid date
9	6	1	1962	31 May, 1962
10	6	2	1962	1 June, 1962
11	6	30	1962	29 June, 1962
12	6	31	1962	Invalid date
13	6	32	1962	Invalid date
14	0	15	1962	Invalid date
15	1	15	1962	14 January, 1962
16	2	15	1962	14 February, 1962
17	11	15	1962	14 November, 1962
18	12	15	1962	14 December, 1962
19	13	15	1962	Invalid date

Software Testing

In case of worst test case total test cases are 5^n. Hence, 125 test cases will be generated in worst test cases. The worst test cases are given below:

Test Case	*Month*	*Day*	*Year*	*Expected output*
1	1	1	1900	31 December, 1899
2	1	1	1901	31 December, 1900
3	1	1	1962	31 December, 1961
4	1	1	2024	31 December, 2023
5	1	1	2025	31 December, 2024
6	1	2	1900	1 January, 1900
7	1	2	1901	1 January, 1901

Software Testing

Equivalence Class Testing

In this method, input domain of a program is partitioned into a finite number of equivalence classes such that one can reasonably assume, but not be absolutely sure, that the test of a representative value of each class is equivalent to a test of any other value.

Two steps are required to implementing this method:

1. The equivalence classes are identified by taking each input condition and partitioning it into valid and invalid classes. For example, if an input condition specifies a range of values from 1 to 999, we identify one valid equivalence class [1<item<999]; and two invalid equivalence classes [item<1] and [item>999].

2. Generate the test cases using the equivalence classes identified in the previous step. This is performed by writing test cases covering all the valid equivalence classes. Then a test case is written for each invalid equivalence class so that ***no test contains more than one invalid class***. This is to ensure that no two invalid classes mask each other.

Software Testing

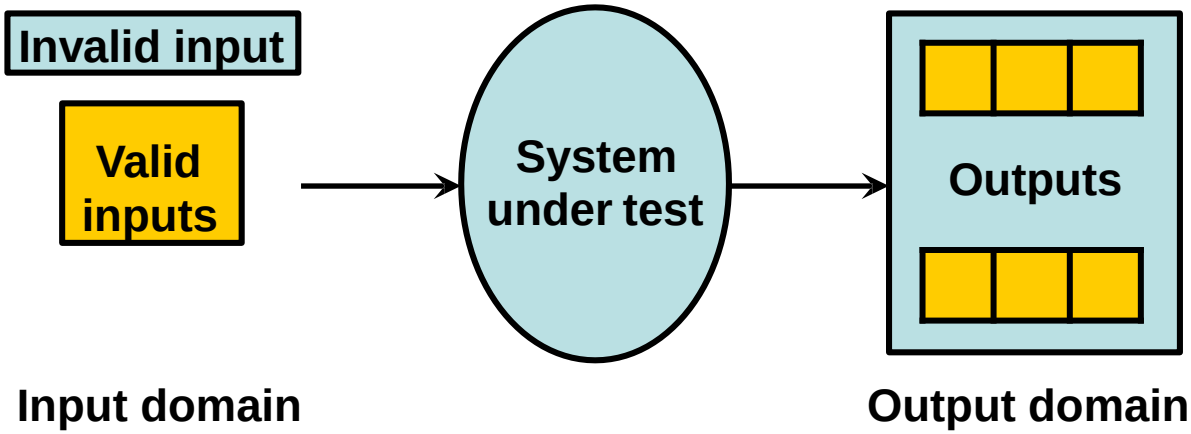

Fig. 7: Equivalence partitioning

Most of the time, equivalence class testing defines classes of the input domain. However, equivalence classes should also be defined for output domain. Hence, we should design equivalence classes based on input and output domain.

Software Testing

Example 8.7

Consider the program for the determination of nature of roots of a quadratic equation as explained in example 8.1. Identify the equivalence class test cases for output and input domains.

Software Testing

Solution

Output domain equivalence class test cases can be identified as follows:

O_1={<a,b,c>:Not a quadratic equation if a = 0}

O_2={<a,b,c>:Real roots if (b^2-4ac)>0}

O_3={<a,b,c>:Imaginary roots if (b^2-4ac)<0}

O_4={<a,b,c>:Equal roots if (b^2-4ac)=0}`

The number of test cases can be derived form above relations and shown below:

Test case	*a*	*b*	*c*	*Expected output*
1	0	50	50	Not a quadratic equation
2	1	50	50	Real roots
3	50	50	50	Imaginary roots
4	50	100	50	Equal roots

Software Testing

We may have another set of test cases based on input domain.

I_1= {a: a = 0}

I_2= {a: a < 0}

I_3= {a: 1 ≤ a ≤ 100}

I_4= {a: a > 100}

I_5= {b: 0 ≤ b ≤ 100}

I_6= {b: b < 0}

I_7= {b: b > 100}

I_8= {c: 0 ≤ c ≤ 100}

I_9= {c: c < 0}

I_{10}={c: c > 100}

Software Testing

Test Case	*a*	*b*	*c*	*Expected output*
1	0	50	50	Not a quadratic equation
2	-1	50	50	Invalid input
3	50	50	50	Imaginary Roots
4	101	50	50	invalid input
5	50	50	50	Imaginary Roots
6	50	-1	50	invalid input
7	50	101	50	invalid input
8	50	50	50	Imaginary Roots
9	50	50	-1	invalid input
10	50	50	101	invalid input

Software Testing

Example 8.8

Consider the program for determining the previous date in a calendar as explained in example 8.3. Identify the equivalence class test cases for output & input domains.

Software Testing

Solution

Output domain equivalence class are:

O_1={<D,M,Y>: Previous date if all are valid inputs}

O_2={<D,M,Y>: Invalid date if any input makes the date invalid}

Test case	*M*	*D*	*Y*	*Expected output*
1	6	15	1962	14 June, 1962
2	6	31	1962	Invalid date

Software Testing

We may have another set of test cases which are based on input domain.

I_1={month: $1 \leq m \leq 12$}

I_2={month: $m < 1$}

I_3={month: $m > 12$}

I_4={day: $1 \leq D \leq 31$}

I_5={day: $D < 1$}

I_6={day: $D > 31$}

I_7={year: $1900 \leq Y \leq 2025$}

I_8={year: $Y < 1900$}

I_9={year: $Y > 2025$}

Software Testing

Inputs domain test cases are :

Test Case	*M*	*D*	*Y*	*Expected output*
1	6	15	1962	14 June, 1962
2	-1	15	1962	Invalid input
3	13	15	1962	invalid input
4	6	15	1962	14 June, 1962
5	6	-1	1962	invalid input
6	6	32	1962	invalid input
7	6	15	1962	14 June, 1962
8	6	15	1899	invalid input (Value out of range)
9	6	15	2026	invalid input (Value out of range)

Software Testing

Example – 8.9

Consider the triangle problem specified in a example 8.3. Identify the equivalence class test cases for output and input domain.

Software Testing

Solution

Output domain equivalence classes are:

O_1={<*x*,*y*,*z*>: Equilateral triangle with sides *x*,*y*,*z*}
O_2={<*x*,*y*,*z*>: Isosceles triangle with sides *x*,*y*,*z*}
O_3={<*x*,*y*,*z*>: Scalene triangle with sides *x*,*y*,*z*}
O_4={<*x*,*y*,*z*>: Not a triangle with sides *x*,*y*,*z*}

The test cases are:

Test case	*x*	*y*	*z*	*Expected Output*
1	50	50	50	Equilateral
2	50	50	99	Isosceles
3	100	99	50	Scalene
4	50	100	50	Not a triangle

Software Testing

Input domain based classes are:

$I_1=\{x: x < 1\}$

$I_2=\{x: x > 100\}$

$I_3=\{x: 1 \leq x \leq 100\}$

$I_4=\{y: y < 1\}$

$I_5=\{y: y > 100\}$

$I_6=\{y: 1 \leq y \leq 100\}$

$I_7=\{z: z < 1\}$

$I_8=\{z: z > 100\}$

$I_9=\{z: 1 \leq z \leq 100\}$

Software Testing

Some inputs domain test cases can be obtained using the relationship amongst x,y and z.

I_{10}={< x,y,z >: x = y = z}

I_{11}={< x,y,z >: x = y, x ≠ z}

I_{12}={< x,y,z >: x = z, x ≠ y}

I_{13}={< x,y,z >: y = z, x ≠ y}

I_{14}={< x,y,z >: x ≠ y, x ≠ z, y ≠ z}

I_{15}={< x,y,z >: x = y + z}

I_{16}={< x,y,z >: x > y +z}

I_{17}={< x,y,z >: y = x +z}

I_{18}={< x,y,z >: y > x + z}

I_{19}={< x,y,z >: z = x + y}

I_{20}={< x,y,z >: z > x +y}

Software Testing

Test cases derived from input domain are:

Test case	*x*	*y*	*z*	*Expected Output*
1	0	50	50	Invalid input
2	101	50	50	Invalid input
3	50	50	50	Equilateral
4	50	0	50	Invalid input
5	50	101	50	Invalid input
6	50	50	50	Equilateral
7	50	50	0	Invalid input
8	50	50	101	Invalid input
9	50	50	50	Equilateral
10	60	60	60	Equilateral
11	50	50	60	Isosceles
12	50	60	50	Isosceles
13	60	50	50	Isosceles

(Contd.)...

Software Testing

Test case	*x*	*y*	*z*	*Expected Output*
